Phase 1 Presentation – Guidelines

(Phase 1 must demonstrate 50% of the project implementation)

1. Overview

The Phase 1 presentation is a progress review. By this stage, each team is expected to have completed and be able to demonstrate at least 50% of the total project implementation.

The presentation should build directly on your literature review: the problem statement, objective, and research gap you identified there should now be reflected in a concrete, partially working implementation.

2. ‘50% Implementation’ Means

At minimum, by Phase 1 you should have:

- A finalized methodology and system/architecture design.
- The dataset collected, cleaned, and pre-processed (or a substantial portion of it).
- The core model or pipeline implemented and running end-to-end on at least a subset of data.
- Some preliminary results — even partial metrics, sample outputs, or baseline performance.
- A clear, realistic plan for completing the remaining 50% in Phase 2.

3. Suggested Presentation Structure

Use the following as a guide. Adapt the number of slides to your project, but keep the overall flow. Total: approximately 12–18 slides.

Slide	Section	What to include	Approx. slides
1	Title & Team	Project title, team number, member names with roll numbers, guide/coordinator name.	1
2	Introduction & Problem Statement	Brief background, the problem you are solving, and your objective.	1–2
3	Literature Review Summary	Key takeaways from the 5 papers and the identified research gap (condensed).	1–2
4	Proposed Methodology / Architecture	Block diagram of your approach, model/architecture chosen, and workflow.	2–3
5	Dataset	Source, size, classes/labels, pre-processing and split done so far.	1
6	Implementation Progress (50%)	What is actually built and working: modules completed, code demo/screenshots, partial results.	3–4
7	Results So Far	Preliminary outputs, metrics, plots, or sample predictions from the completed 50%.	1–2
8	Challenges & Plan for Phase 2	Problems faced, and a clear plan + timeline for the remaining 50%.	1–2
9	Conclusion & References	Short summary of progress and IEEE-style references.	1

4. PPT Preparation Guidelines

4.1 Content

- Follow the ONE idea per slide rule. Do not crowd a slide with multiple concepts.
- Use bullet points, not paragraphs. Aim for **the 6×6 guideline: at most ~6 bullets per slide and ~6 words per bullet**.
- Prefer diagrams, architecture blocks, flowcharts, tables, and plots over dense text.
- Every result must be your own work from the current implementation — clearly label what is done vs. pending.
- Include a block diagram of your architecture — it is the most important slide of a DL project review. **It must be your own work based on your actual implementation. AI-generated architectures, diagrams, or presentations are not permitted.**

4.2 Design & Readability

- Use a clean, consistent template across all slides (same theme, colours, and fonts).
- Font size: titles ≥ 28 pt, body text ≥ 18 –20 pt.
- Number your slides.
- Ensure all images, plots, and screenshots are high-resolution — not blurry or stretched.

4.3 Delivery

- Keep to the allotted time (typically 10–15 minutes + Q&A).
- **Every team member must speak.** Divide the sections fairly among the team.
- Keep a backup of the presentation and any demo files on more than one device.

4.4 Common Mistakes to Avoid

- Presenting only plans and theory with no working implementation.
- Copy-pasting figures or results from the reference papers and passing them off as your own.
- Overloaded, text-heavy slides that are read out word-for-word.
